

UNDERSTANDING FACTORS ATTRIBUTING TO TRAFFIC ACCIDENTS IN CALIFORNIA

Team 6

John O'Boyle, Derek Yang, Isaias Larios, Kaixin Lin

MOTIVATION AND OBJECTIVE

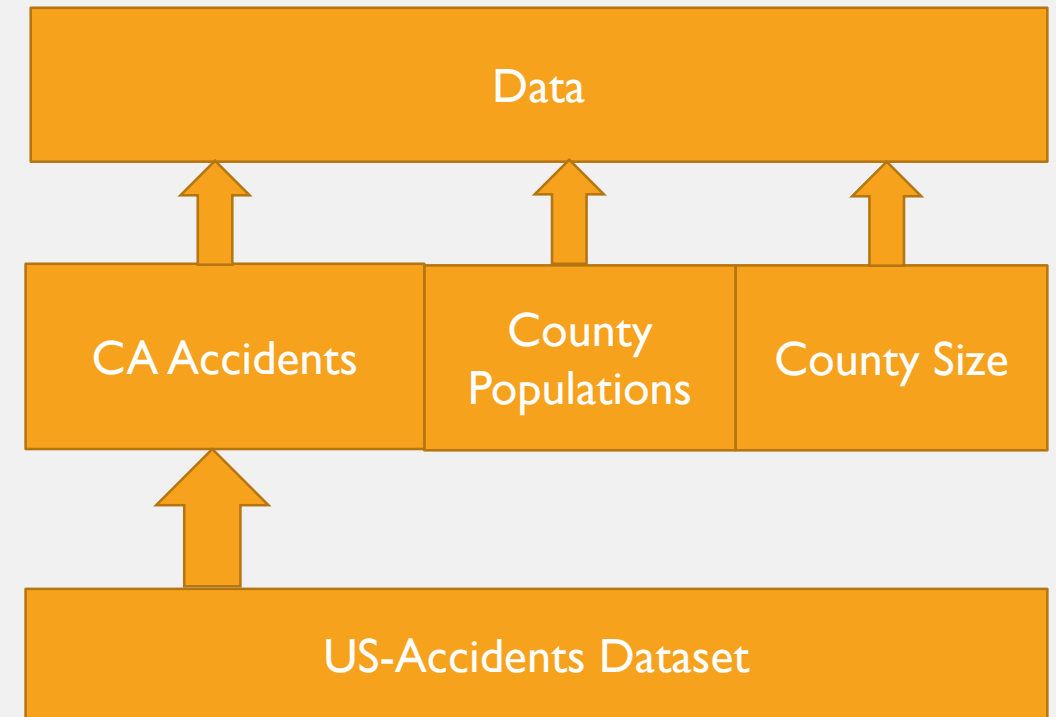

- The state of California has the most licensed drivers in the United States.
- We also account for a large portion of vehicle accidents in the United States.
- Analysis of accident data would provide insight into the factors that lead to vehicle accidents and their severity in the most populous state in America

Vehicle Accidents by State

US-ACCIDENTS OPEN DATASET

- US-Accidents open dataset[1]
(https://smoosavi.org/datasets/us_accidents)
contains data on 3.5 million traffic accidents collected from February 2016 to June 2020 for the Contiguous United States.
- California County size information
<https://www.counties.org/pod/square-mileage-county>
- 2020 California County Population
<https://worldpopulationreview.com/us-counties/states/ca>

Weather

Time of day and traffic
patterns

**Traffic hotspots
and high-risk locations**

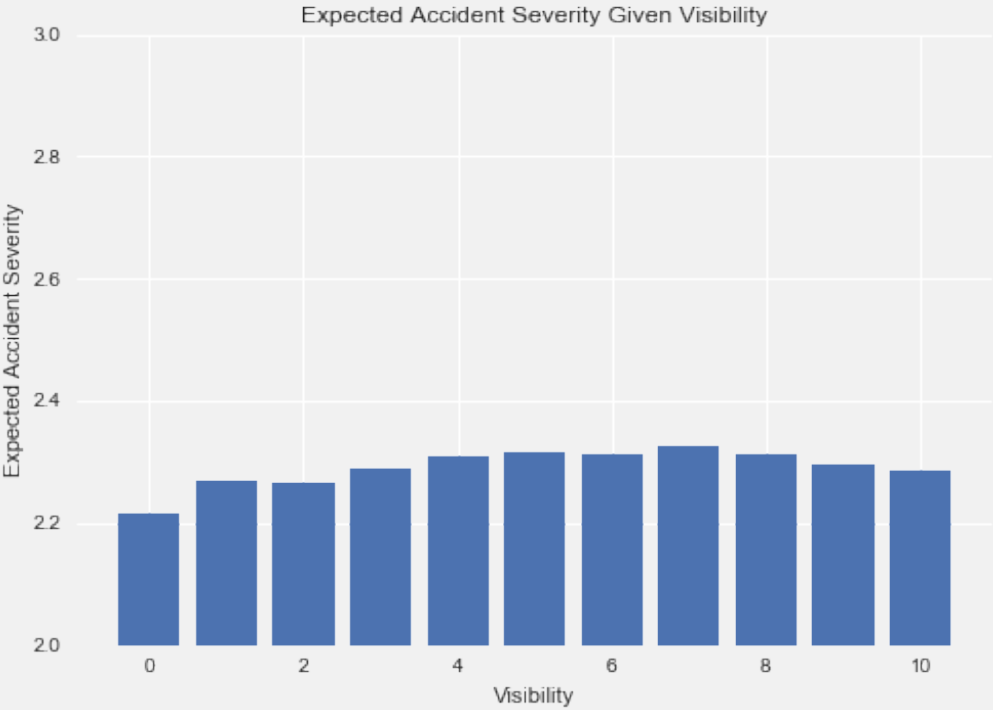

SEVERITY

- Severity of an accident is measured by the impact of the accident on the surrounding traffic.
- A 1 indicates low traffic impact while a 4 can be large collisions which impact traffic for a longer period.

Severity of Accidents

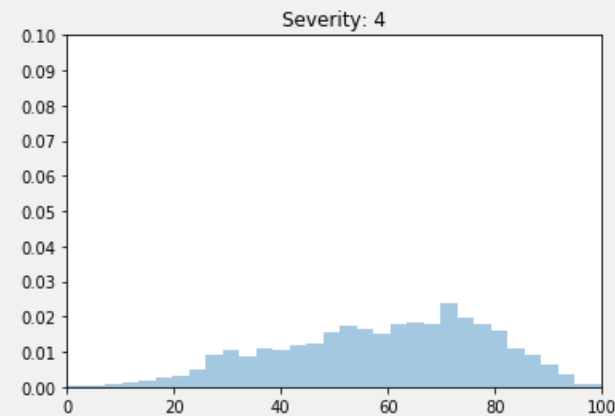

VISIBILITY AFFECTING ACCIDENT SEVERITY

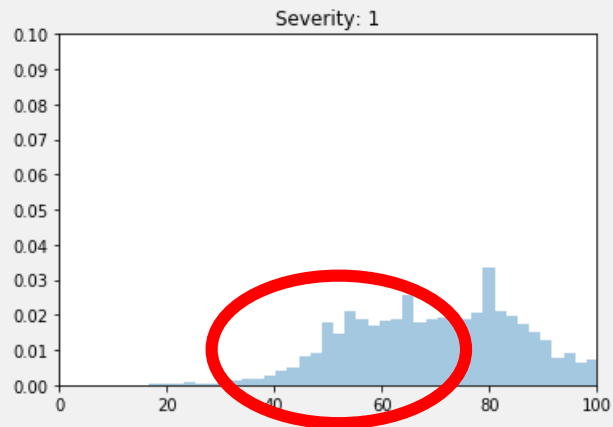

Accident Severity	1	2	3	4
Expected Visibility: $E(\text{Vis})$	9.5	9.21	9.22	9.14
Variance $V(\text{Vis})$	2.24	3.99	3.74	4.45
Sample Size	197	149,242	105,986	261

EFFECT OF TEMPERATURE ON ACCIDENT SEVERITY

Severity	Temperature(F) mean
1	70.741
2	61.994
3	61.859
4	59.021

EFFECT OF TEMPERATURE ON ACCIDENT SEVERITY

Severity	Temperature(F) mean
1	70.741
2	61.994
3	61.859
4	59.021

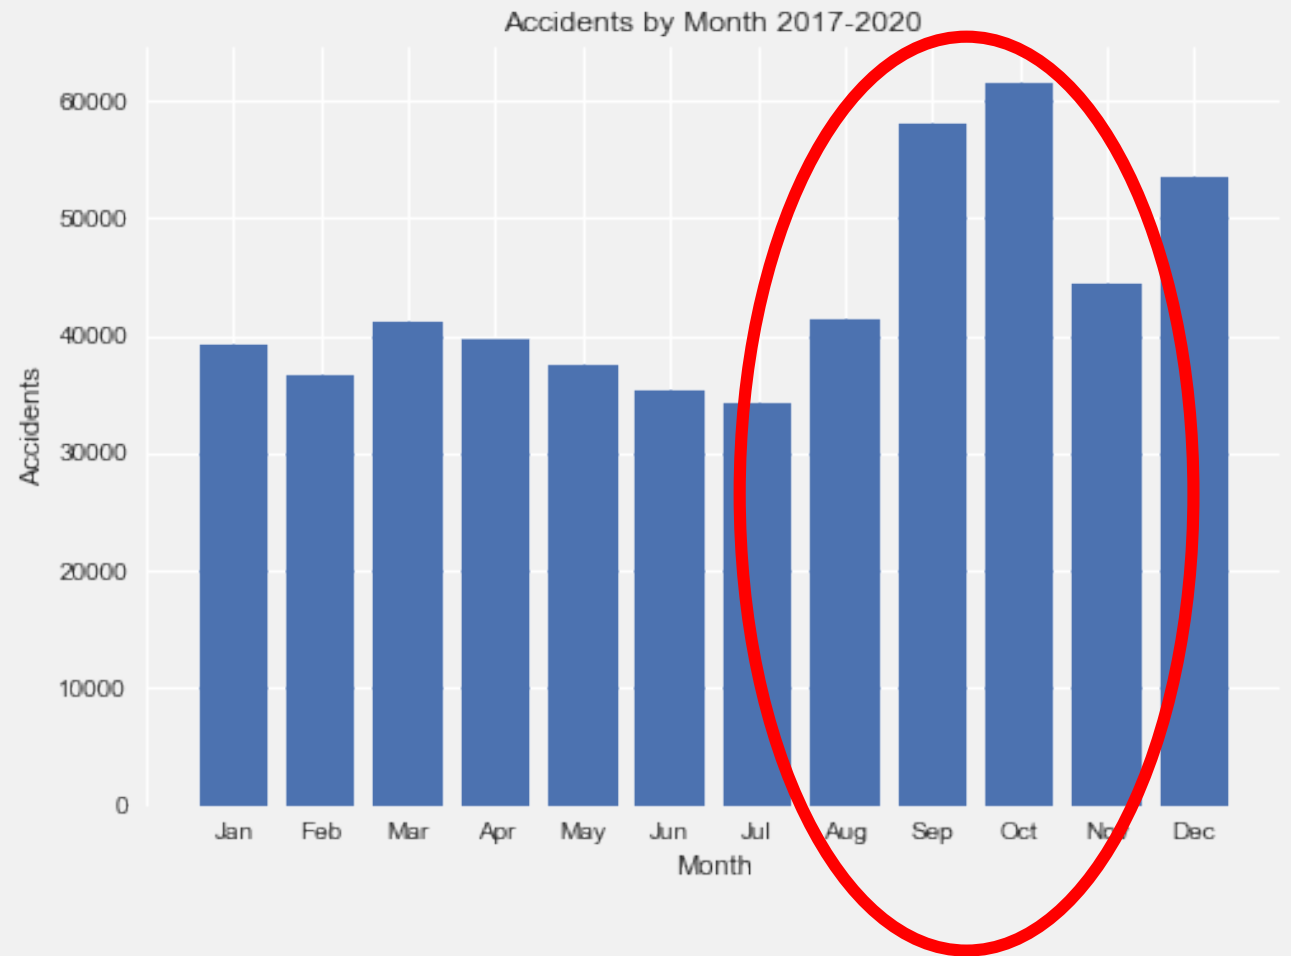

EFFECT OF MONTH ON NUMBER OF ACCIDENTS

- Starting August, the number of accidents begin to increase.
- Factors that can contribute are:
 - 1) Younger drivers tend to drive more after summer
 - 2) Longer commutes due to holidays that occur at end of year

EFFECT OF MONTH ON ACCIDENT OCCURANCES

- Starting August, the number of accidents begin to increase.
- Factors that can contribute are:
 - 1) Younger drivers tend to drive more after summer
 - 2) Longer commutes due to holidays that occur at end of year

EFFECT OF DAY OF THE WEEK ON ACCIDENT OCCURRENCES

- Despite previous beliefs, the weekend exhibits a drop in the number of accidents.
- The work week (Mon-Friday) have a consistent number accidents which could be contributed to accidents occurring while driving to or from work.

EFFECT OF HOUR OF DAY ON ACCIDENT OCCURRENCES

- Accidents are quite low early in the morning or late at night but exhibit two distinct peaks.
- Between 8am-10am and 3-6pm we see the most accidents occurring.
- These times are related to “rush hour” when drivers are heading to and from work.
- Supports conclusion from accidents by day of week that accidents are more likely to happen on daily work commutes.

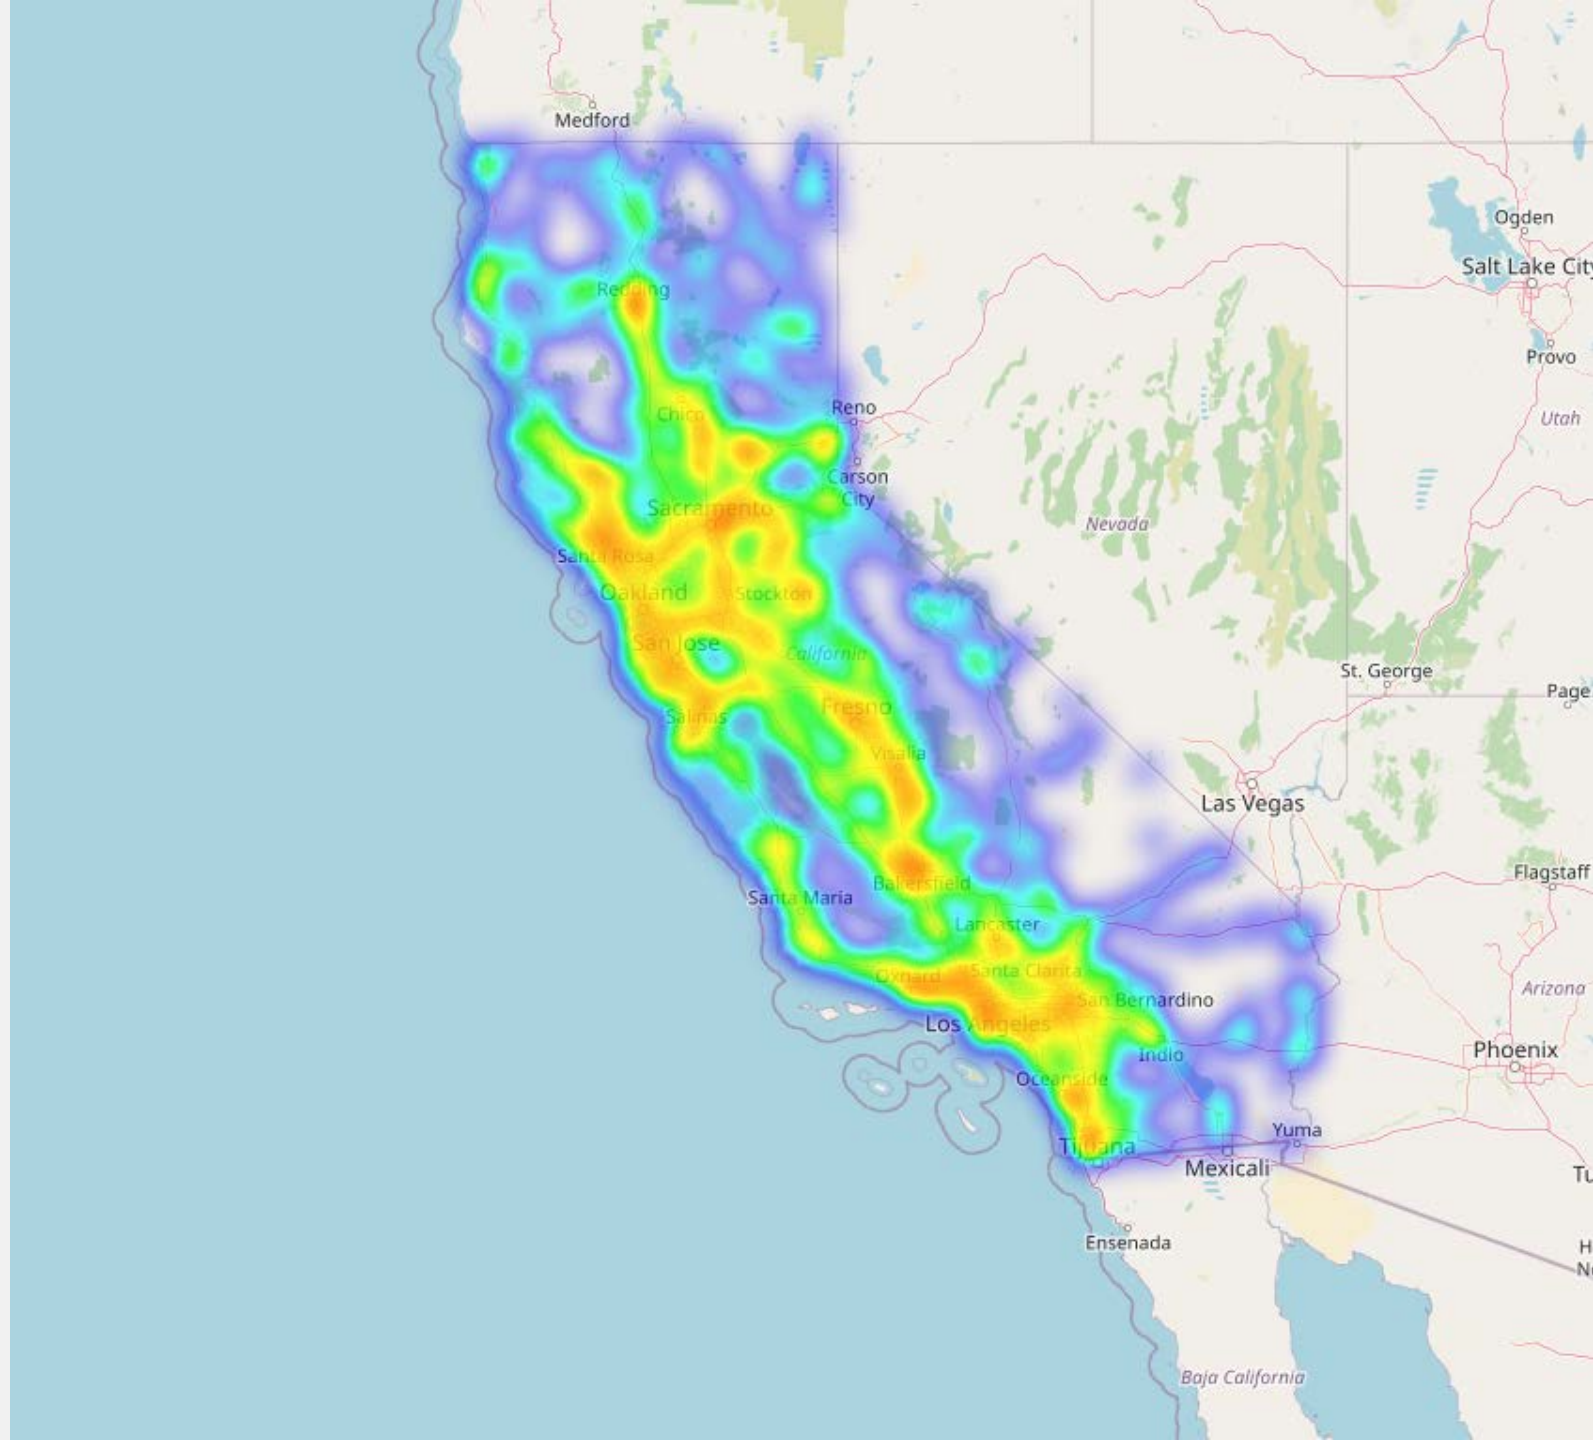

EFFECT OF HOUR OF DAY ON ACCIDENT OCCURRENCES

- Accidents are quite low early in the morning or late at night but exhibit two distinct peaks.
- Between 8am-10am and 3-6pm we see the most accidents occurring.
- These times are related to “rush hour” when drivers are heading to and from work.
- Supports conclusion from accidents by day of week that accidents are more likely to happen on daily work commutes.

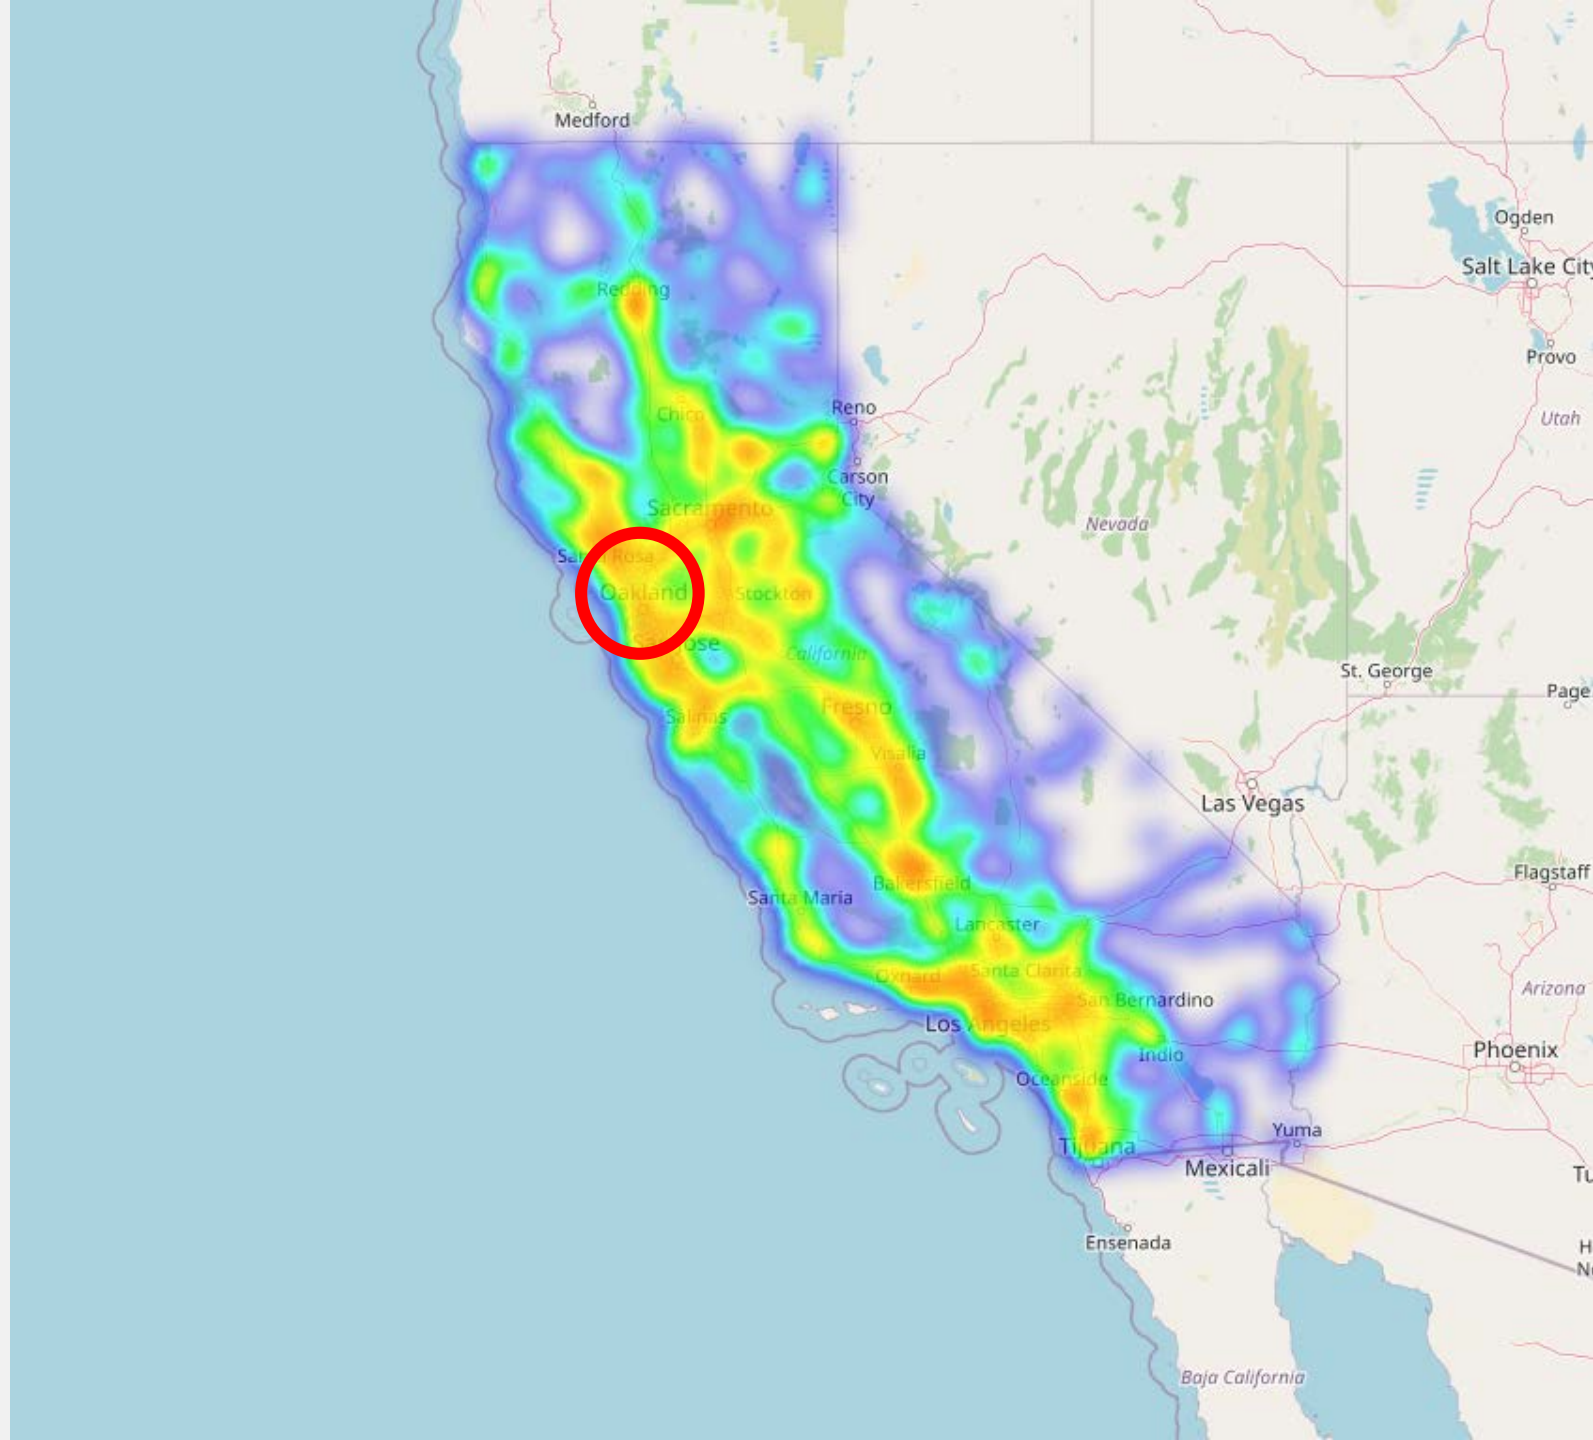

CALIFORNIA ACCIDENT HEATMAP

- We can see that areas that people generally believe to be dangerous areas to drive in are indeed hotspots.

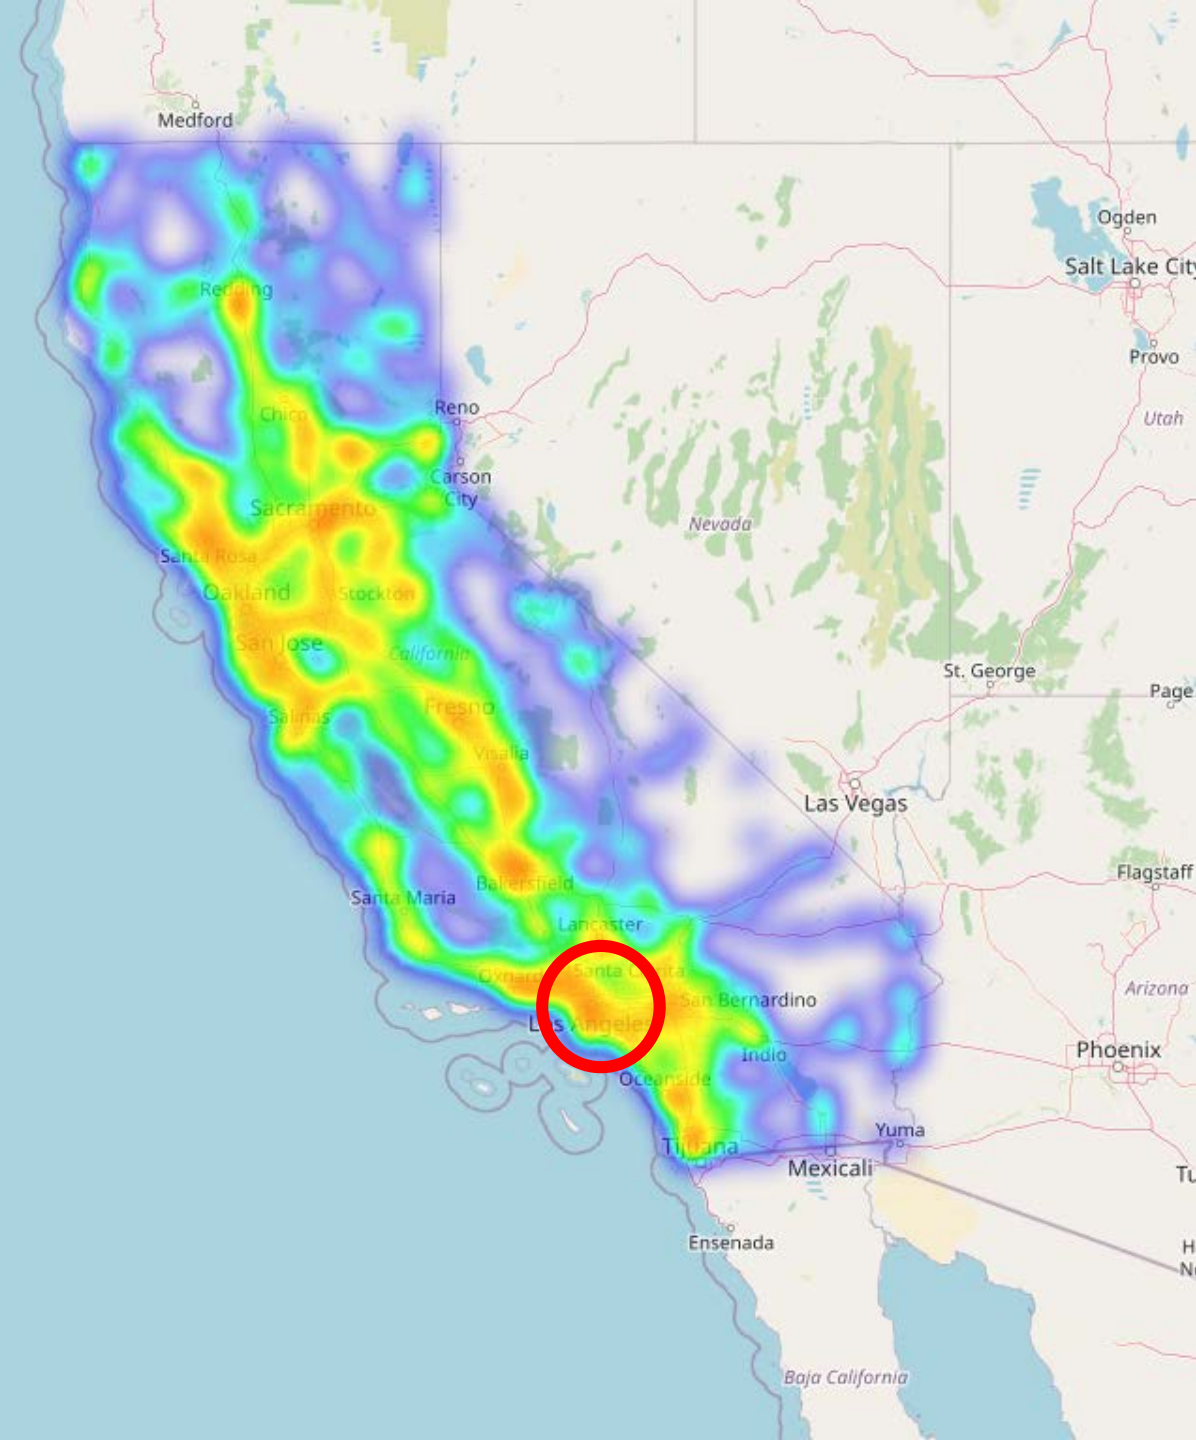

CALIFORNIA ACCIDENT HEATMAP

- We can see that areas that people generally believe to be dangerous areas to drive in are indeed hotspots.
- **San Francisco**

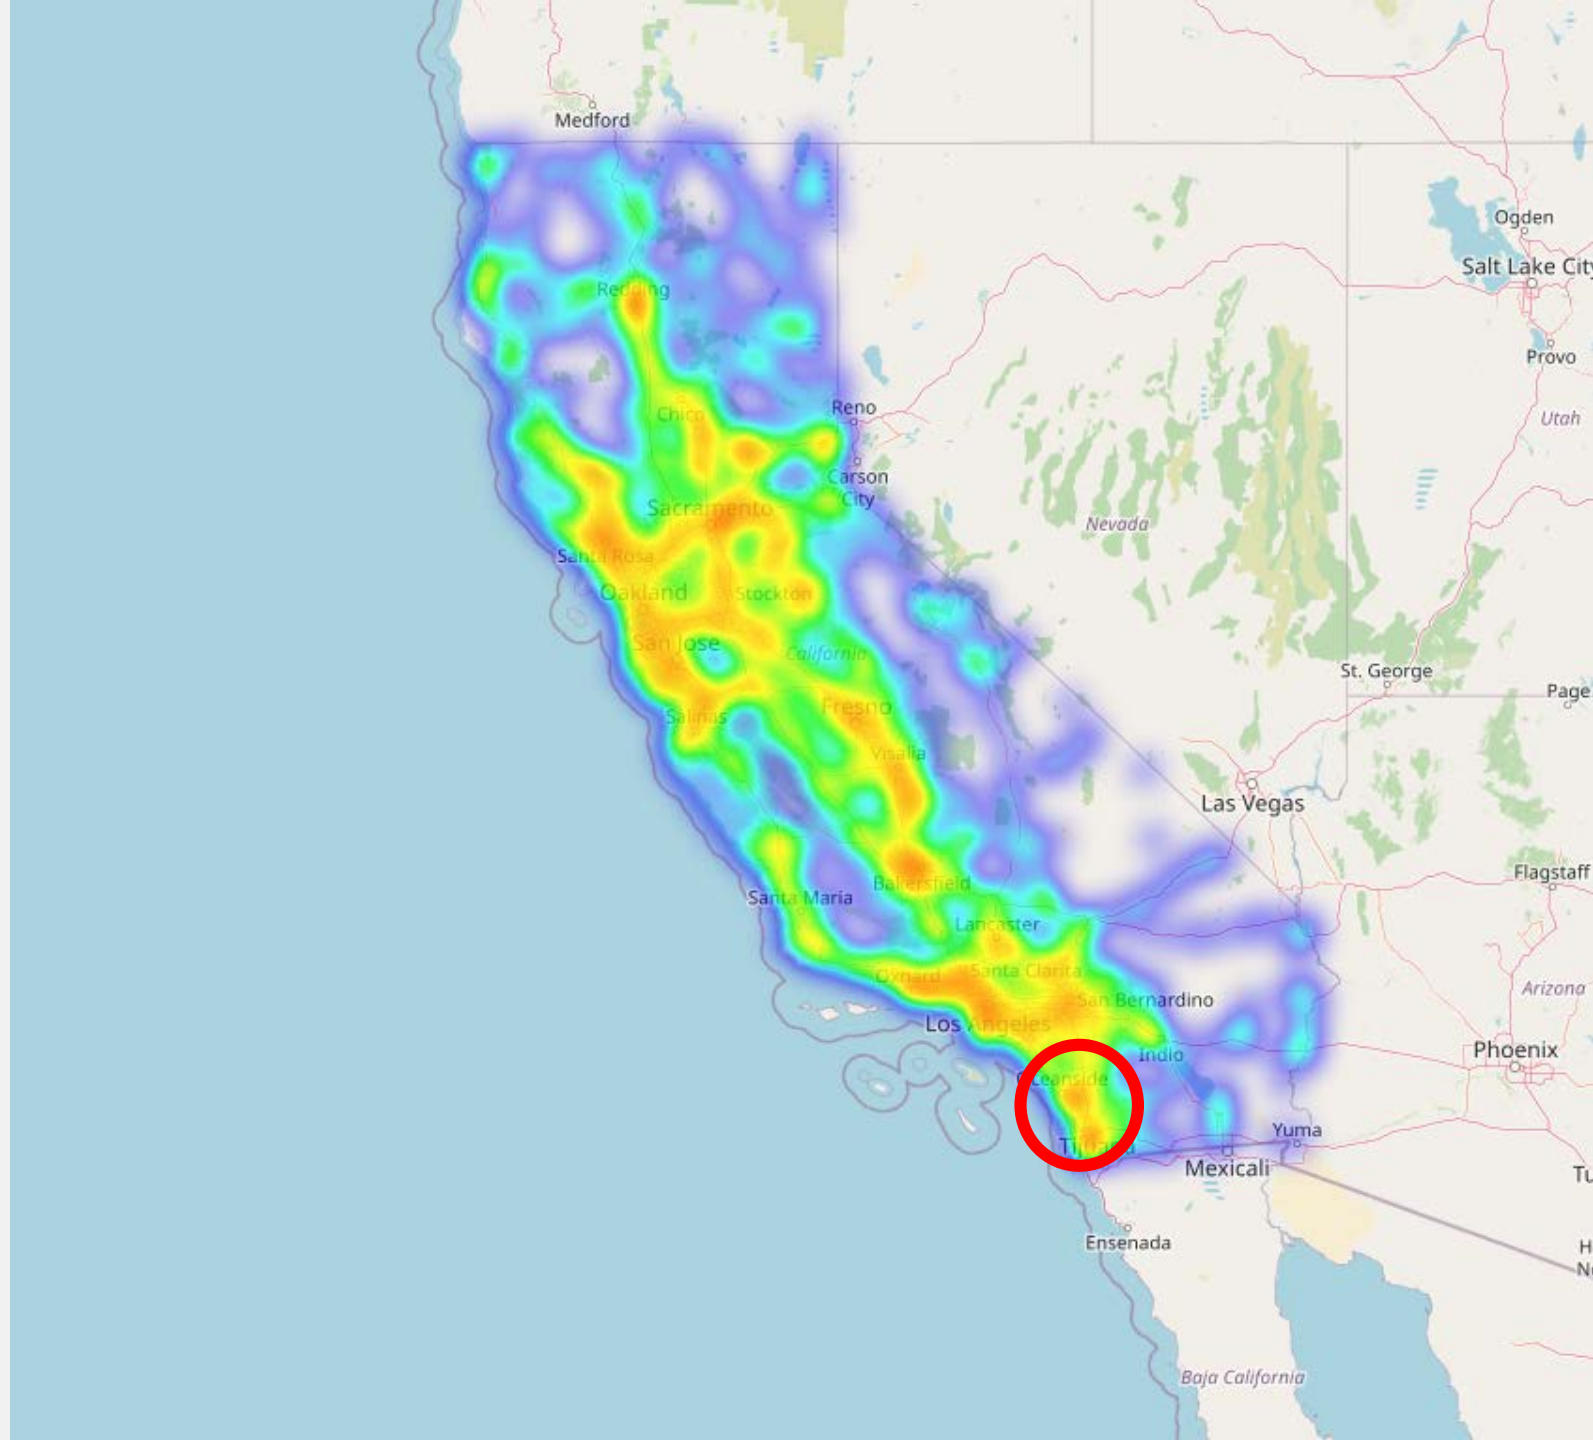

CALIFORNIA ACCIDENT HEATMAP

- We can see that areas that people generally believe to be dangerous areas to drive in are indeed hotspots.
- San Francisco, Los Angeles

CALIFORNIA ACCIDENT HEATMAP

- We can see that areas that people generally believe to be dangerous areas to drive in are indeed hotspots.
- San Francisco, Los Angeles, **San Diego**

COUNTIES WITH THE MOST ACCIDENTS

- The top 6 counties out of the 58 in California comprise nearly 63.6% of accidents in the state.
- However, these top 6 counties are also some of the most populous counties in California.
- Other possible ways to measure?

Vehicle Accidents by County in California

ACCIDENTS PER SQUARE MILE

- There is a clear correlation between accidents per square mile and population density
- San Diego and Sacramento accounted for large number of accidents but are not listed in the top 12 counties when looking at per square mile.
- Orange county has a higher population than LA or Alameda yet lower accidents per square mile

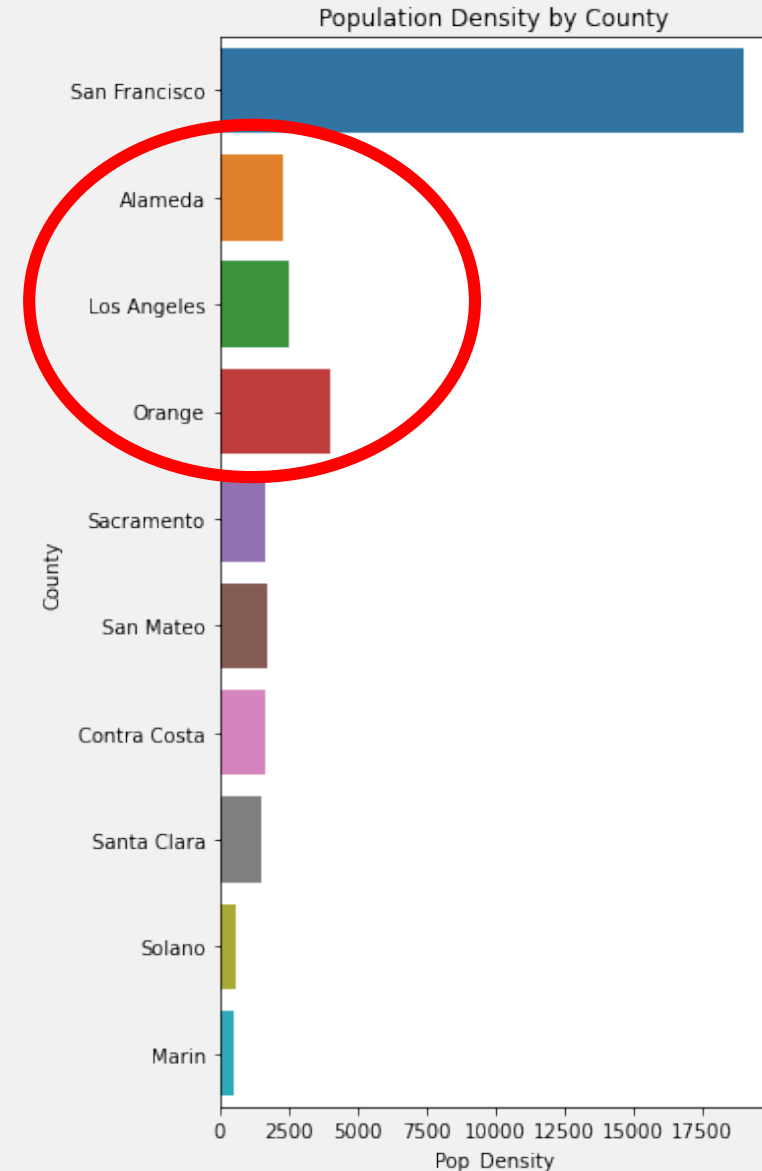

ACCIDENTS PER SQUARE MILE

- There is a clear correlation between accidents per square mile and population density
- **San Diego and Sacramento accounted for large number of accidents but are not listed in the top 12 counties when looking at per square mile.**
- Orange county has a higher population than LA or Alameda yet lower accidents per square mile

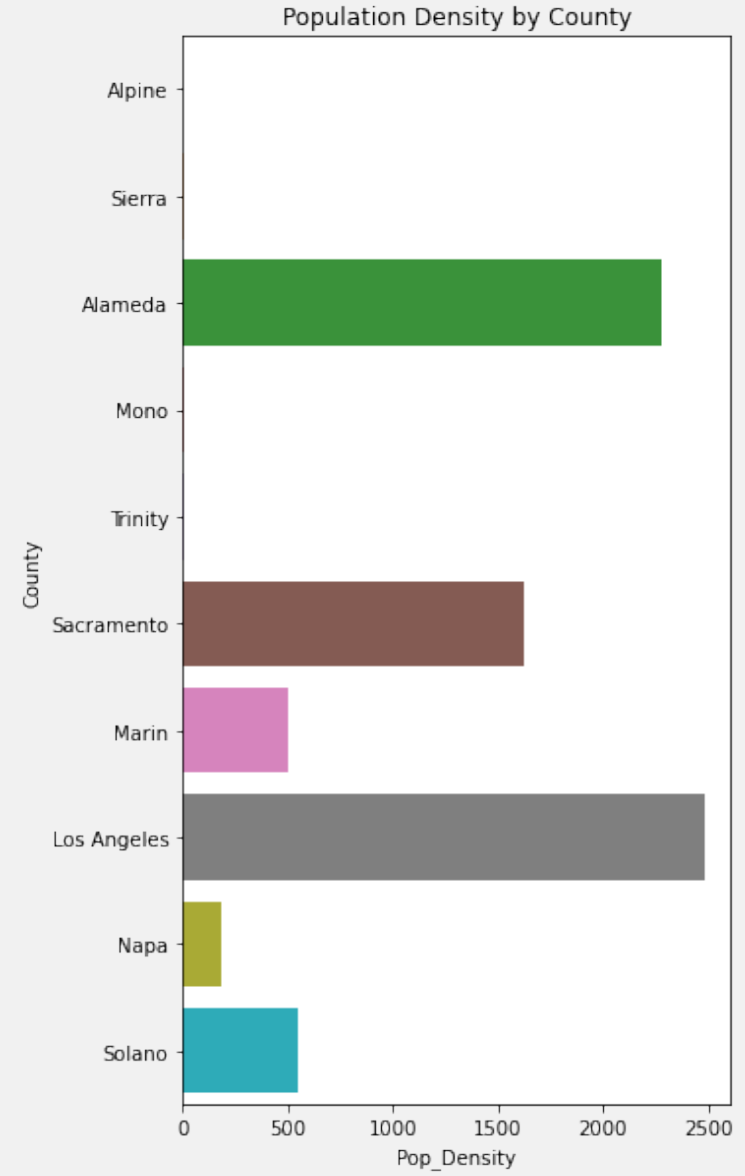

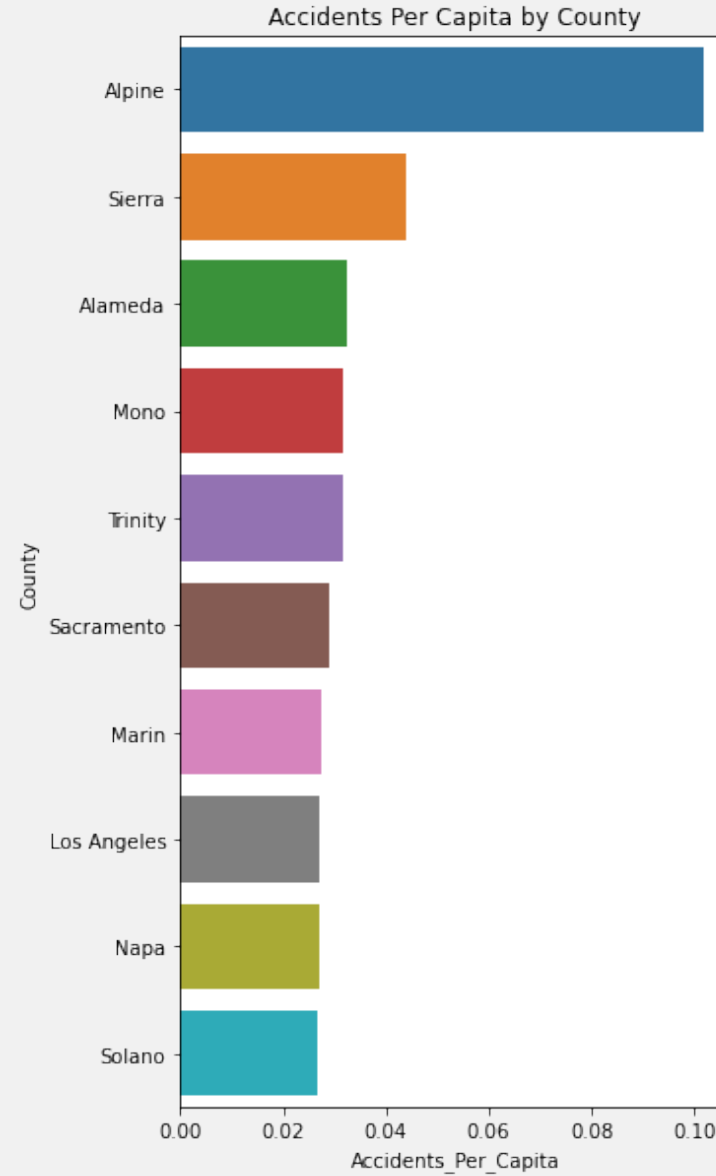

ACCIDENTS PER SQUARE MILE

- There is a clear correlation between accidents per square mile and population density
- San Diego and Sacramento accounted for large number of accidents but are not listed in the top 12 counties when looking at per square mile.
- **Orange county has a higher population than LA or Alameda yet lower accidents per square mile.**

ACCIDENTS PER CAPITA

- Using a per capita approach, we see that only three counties with high population appear.
- Counties like Alpine are listed at the top of this graph, this is because they are mountainous locations (i.e.: dangerous roads) and could have a high amount of traffic passing through.

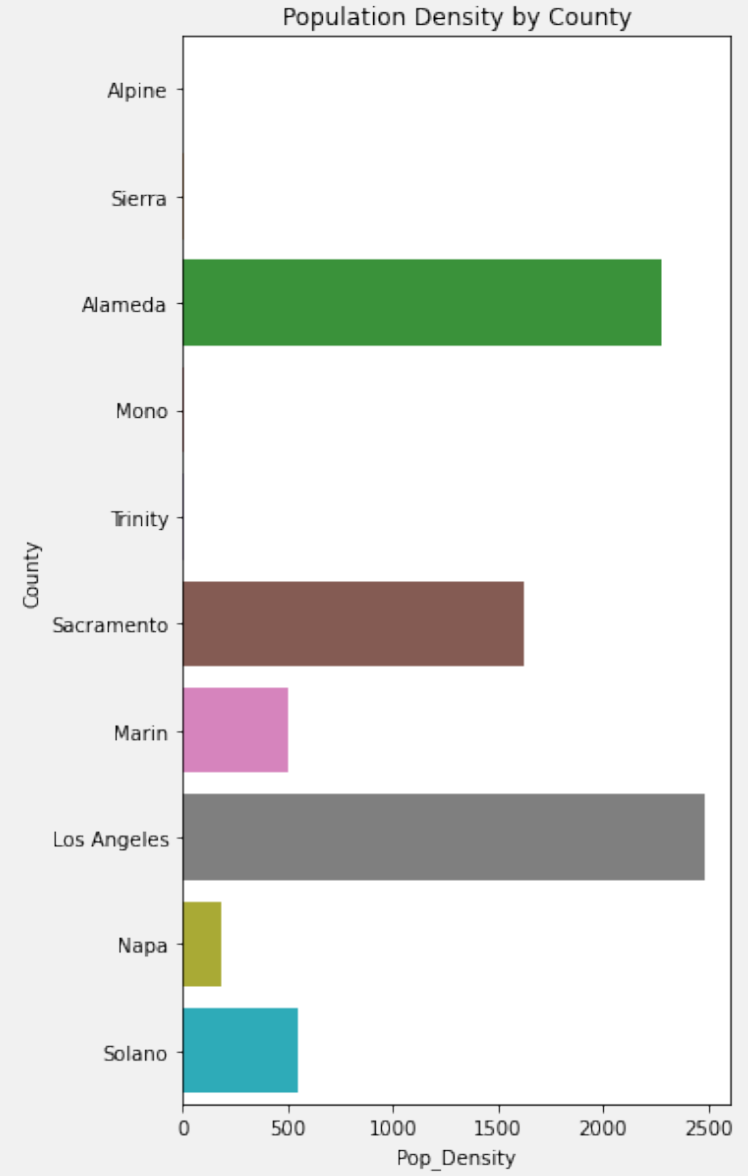

ACCIDENTS PER CAPITA

- Using a per capita approach, we see that only three counties with high populations appear.
- Counties like Alpine are listed at the top of this graph, this is because they are mountainous locations (i.e.: dangerous roads) and could have a high amount of traffic passing through when compared to their population.

ACCIDENTS PER CAPITA

- Using a per capita approach, we see that only three counties with high population appear.
- **Counties like Alpine are listed at the top of this graph, this is because they are mountainous locations (i.e.: dangerous roads) and could have a high amount of traffic passing through.**

DOES POPULATION DENSITY AFFECT ACCIDENT LIKELIHOOD?

DOES POPULATION DENSITY AFFECT ACCIDENT LIKELIHOOD?

DOES POPULATION DENSITY AFFECT ACCIDENT LIKELIHOOD?

HIGH-RISK LOCATIONS

- Crossings, traffic signals, and junctions are the majority contributors in accident location.
- Traffic signals and crossings comprise more of the total at lower severities.
- Junctions comprise the majority of accidents at higher severities.

Severity: 1

Severity: 2

Severity: 3

Severity: 4

CONCENTRATED ACCIDENT AREAS

- Connection of the Oakland Bay Bridge and the West Side of Yerba Buena Island had the most accidents (in all of CA) within 100 yards.
- On any given day there is approximately a 45% chance an accident will occur within 100 yards of that location

CONCENTRATED ACCIDENT AREAS (LOCAL)

San Diego County

City of La Jolla

CONCLUSIONS

No Effect or Reduced Risk

Visibility

Increased Risk

CONCLUSIONS

No Effect or Reduced Risk

- Visibility was not found to affect the severity of an accident

Temperature

Increased Risk

CONCLUSIONS

Month

No Effect or Reduced Risk

- Visibility was not found to affect the severity of an accident

Increased Risk

- Lower Temperatures were associated to increased severity

CONCLUSIONS

No Effect or Reduced Risk

- Visibility was not found to affect the severity of an accident

Day of Week
Hour of Day

Increased Risk

- Lower Temperatures were associated to increased severity
- Months towards the end of the year (August-December) were found to be more likely

CONCLUSIONS

No Effect or Reduced Risk

- Visibility was not found to affect the severity of an accident

County Location

Increased Risk

- Lower Temperatures were associated to increased severity
- Months towards the end of the year (August-December) were found to be more likely
- The daily work commute is found to have the most accident occurrences

CONCLUSIONS

No Effect or Reduced Risk

- Visibility was not found to affect the severity of an accident
- Higher populated counties such as LA were not found to increase likelihood of an accident per capita

High-risk Locations

Increased Risk

- Lower Temperatures were associated to increased severity
- Months towards the end of the year (August-December) were found to be more likely
- The daily work commute is found to have the most accident occurrences
- Mountainous Regions are found to have a very high per capita rate of accidents

THANK YOU

No Effect or Reduced Risk

- Visibility was not found to affect the severity of an accident
- Higher populated counties such as LA were not found to increase likelihood of an accident per capita.
- Crosswalks and traffic signals area associated with lower severity accidents

Questions or Comments?

Increased Risk

- Lower Temperatures were associated to increased severity
- Months towards the end of the year (August-December) were found to be more likely
- The daily work commute is found to have the most accident occurrences
- Mountainous Regions are found to have a very high per capita rate of accidents
- Junctions are hotspots for high severity accidents.
